

Since 2010

WHAT & WHEN

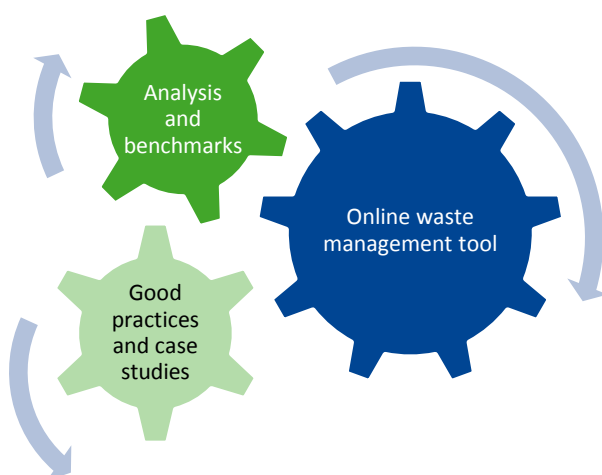

With the aim of contributing to the European recycling society, ACR+ is working on the analysis, comparison and promotion of best practices concerning waste selective collection, treatment alternatives, financial schemes and costs optimisation. In 2010 ACR+ launched a **European Observatory of municipal waste performances**, focusing first and foremost on the analysis of recycling performances across different regional/local authorities in Europe and acting as a platform for sharing experiences and demonstrating statistical best practices.

In 2017, ACR+ has collected municipal waste data from 17 European cities and provided a detailed analysis in a publication issued in December 2017. The collected data were organised in a waste database which will be improved and expanded with other local data, thus enabling further analysis. ACR+ will take advantage of the various projects it is involved in, especially COLLECTORS, whose first year will be mainly devoted to data collection. Moreover, the implementation of a Regional Working Group within the COLLECTORS project will allow the invitation of all the Observatory participants to pursue discussions and comparisons among local and regional authorities. ACR+ has also been working with material federations (e.g. the glass federation), in order to analyse their performance and share good practices on recycling.

WHO

The European Observatory comprises **many cities and regions**, members of ACR+. Participation in the work of the Observatory is open to ACR+ members and the working groups might change in the future, depending on the considered topics.
